

## Appendix 6.4 Phase 1 Habitat Survey Target Notes

Target Note	Description	Photograph
1	Stag's horn clubmoss present within dry heath.	
2	Small area of wet heath with a series of pools. Vegetation is dominated by purple moor-grass and cross-leaved heath but with frequent hare's tail cottongrass, particularly around the pools which contain frequent common cottongrass and soft rush and some <i>Sphagnum denticulatum</i> and <i>S. fallax</i> at the margins.	

3

Dry heath which appears to have been affected by heather beetle *Lochmaea suturalis*.

4

Derelict building. Some potential roost features including cavities under lintels but likely to be fairly exposed. Low potential for roosting bats due to location.

## Appendix 6.5 Bat call identification

Recorded bat calls (full spectrum .wav files) were run through Wildlife Acoustics Kaleidoscope Pro auto-identification software, and then the zero-crossings output files were analysed / verified using the Anlook software to confirm the identity of the bats present. Where a zero-crossings file was empty, the original full-spectrum (wav) file was checked, to confirm whether or not a bat pass had been recorded. Where possible, the bat was identified to species level. Species of the genera *Myotis* and *Plecotus* were analysed to genus level as overlapping call parameters make species identification problematic (Hundt, 2012).

For pipistrelle species the following criteria, based on measurements of peak frequency, were used to classify calls:

- Common pipistrelle  $\geq 42$  and  $< 49$  kHz
- Soprano pipistrelle  $\geq 51$  kHz
- Nathusius' pipistrelle  $< 39$  kHz
- Common pipistrelle / Soprano pipistrelle  $\geq 49$  and  $< 51$  kHz
- Common pipistrelle / Nathusius' pipistrelle  $\geq 39$  and  $< 42$  kHz

### *Calculation of relative activity*

The SM4 detectors were configured to record above the level of ambient noise, such as from wind or rain, and set to define a bat pass (P) as a call note of  $> 2$  milliseconds (ms) separated from another by more than one second.

AnlookW (Version 4.2, 2017) software was used to verify bat calls. The software enables analysis of the relative activity (referred to as 'activity' in the text below) of different species of bats by counting the number of bat passes (P) recorded within a unit of time - hour (h) was used. More than one pass of the same species was counted within a sound file if multiple bats were recorded calling simultaneously. During analysis of sound files, it was possible to estimate the minimum number of bats recorded on individual sound files but not whether consecutive sound files had recorded, for example, a number of individual bats passing as they commute to a feeding habitat or one bat calling repeatedly as it flies up and down a feature cannot be distinguished. Although relative abundance cannot therefore be estimated from this analysis, the number of bat passes does provide an indication of the importance of features / habitats to bats by assigning a level of bat activity that is associated with that feature, regardless of the type of activity.

### *Analysis by sunset-sunrise times*

As part of the analysis of nocturnal patterns of behaviour for bats the data were split into discrete time periods relating to their proximity to sunset or sunrise. The time categories (time codes: TC) were as follows:

- TC 0 = before sunset / after sunrise
- TC 1 = 0-20 min after sunset
- TC 2 = 20-40 min after sunset
- TC 3 = 40-60 min after sunset
- TC 4 = 60-80 min after sunset

- TC 5 = 80-100 min after sunset
- TC 6 = 100-120 min after sunset
- TC 7 = Middle of night (varies across seasons)
- TC 8 = 120-100 min before sunrise
- TC 9 = 100-80 min before sunrise
- TC 10 = 80-60 min before sunrise
- TC 11 = 60-40 min before sunrise
- TC 12 = 40-20 min before sunrise
- TC 13 = 20-0 min before sunrise

For each of these categories P/h was calculated to allow a comparison between the activity level recorded in different time periods, and a correction factor was applied to TC7 data to allow for variation in night length throughout the survey season.

Appendix 6.6. Photographs

Ref	Description	Photograph
1	Examples of dry heath from across the Site with heather (top) and bilberry (bottom) dominant.	 <p>The top photograph shows a landscape of dry heath with a mix of purple heather and green bilberry. In the background, several high-voltage power lines with pylons stretch across the horizon under a cloudy sky. The year '2022' is printed in the bottom right corner of the image.</p> <p>The bottom photograph shows a similar landscape but with a higher proportion of green bilberry and less purple heather. The terrain is rolling, and the sky is overcast. The year '2020' is printed in the bottom right corner of the image.</p>

2	<p>Sheep grazed acid grassland dominated by mat grass (U5) in the north-western part of the survey area.</p>	 <p>2020</p>
3	<p>Closely grazed acid grassland on Mynydd Llwyd dominated by common bent and sheep's fescue (U4)</p>	 <p>2020</p>

4	<p>Wet heath with frequent purple moor-grass and cross-leaved heath, south-west of Mynydd Maen.</p>	
5	<p>Conifer plantation above Gwyddon fach.</p>	

6	<p>Pond 3 showing extensive livestock poaching at edges and limited marginal vegetation.</p>	 <p>A photograph of Pond 3 in 2020. The pond is a large, shallow body of water with a dark, rippled surface. The edges are heavily eroded and show signs of extensive livestock poaching, with bare soil and scattered rocks. There is very little marginal vegetation. The background shows a flat landscape under a cloudy sky. The year '2020' is printed in the bottom right corner of the image.</p>
7	<p>Pond 5 with marginal vegetation limited to patchy cover of soft rush.</p>	 <p>A photograph of Pond 5 in 2020. The pond is a smaller, more irregularly shaped body of water. The marginal vegetation is limited to patchy cover of soft rush, which is visible in the foreground and along the edges. The background shows a flat landscape under a cloudy sky. The year '2020' is printed in the bottom right corner of the image.</p>

8	Pond 6 livestock poached with limited marginal vegetation and dry at the time of survey (in 2022)	
9	Pond 15 with emergent and marginal vegetation and good surrounding habitat.	

<p>10</p>	<p>Pond 12 recently dredged at the time of survey in 2020.</p>	
<p>11</p>	<p>Extensive bracken, typical of much of the sloping ground adjacent to the Site.</p>	

<p>12</p>	<p>Area of acid grassland / heath mosaic which had recently been mown prior to 2022 walkover survey, at the centre of the Site.</p>	
<p>13</p>	<p>Species poor hedgerow alongside access route.</p>
